

Working Together

1. How does echolocation work?

A: An animal emits a noise which bounces off an object and back to the animal. This tells the animals how far away their prey is.

2. How might hunting in packs be helpful to the killer whale?

A: They can herd and overwhelm the prey more easily.

3. Why is it important that all the bees in the colony know where the nectar is?

A: So that they can gather it too. Bees work together to feed the whole colony and don't just find food for themselves.

4. How do bees tell each other where to find food?

A: By doing a dance.
